(54) DATA PROCESSOR

(57) Abstract

PURPOSE: To provide a data processor which can surely convert data by simple work.

CONSTITUTION: In the data entry (step S2) of a data file 2, an input format file 1 prepared in advance is used. In the case of an output processing such as a medium convert processing, for example, it is necessary to prepare an output format file 3 and in the output format file 3, however, a desired field in the input format file 1 is described so as to be specified in a prescribed order by the name or the like. Thus, in the output processing (step S4), a control part refers to the contents of the input format file 1 based on the analysis of the output format file 3 and executes an output to an output device after deciding the name of a field constituting one record in a data file 4, field length or data format for each field, etc.
